

asgn07: Instructions

Objectives

- Continue writing PDO
- Build a database with pre-written SQL files
- Prevent SQL injection by writing prepared statements

Setup

- Watch the videos
- Create a new folder named `web250/asgn07-create-bird`
- Download the starter files from Moodle and extract them into your new folder
- Set up a database locally using the files in the `sql-files` folder. Start by creating the database.

Write Code

In the videos, I demonstrate how to write the PDO insert statement. Take that code and modify it so it includes bound, named parameters. This was covered in asgn05-PDO. Use that code as a reference.

Webhost

- Create the database on your Webhost. I left in some helpful hints in the `db_credentials.php` file.
- Remember that you will need to create a user and pair it to your database.
- Upload your code and test it.

Git and GitHub

By now you should be getting used to working with Git and GitHub. Push your finished code to GitHub

Submit

Submit your GitHub and Webhost addresses in Moodle.
